Subject: Preliminary Surface Water (Ditch Sample) and Residential Soil Sample

Hello All:

I have my contractor working on a map so that we can see where each of the samples were taken. But here are the preliminary results for the Surface Water (Ditch Sample) and the Residential soils that include ROW drainage path, stain areas across the street, among others. Once I get the map, I will pass it along. You have already received the air sampling that I previously sent.

I have put together a table but I am in the process of gathering the proper comparison data.

Residential Surface Water Ditch Sample: This is more like a waste sample as we took this from the ditch prior to flushing. Not sure how useful this will be. We are still waiting on additional analysis.

Residential Soil Samples: These were composite samples in designated stain areas including the ROW leading from the facility and the properties that had more significant staining. My preliminary evaluation is that everything looked ok except for maybe TPH at one location (ROW drainage leading out of the facility). We are still waiting on additional analysis.

I will get a toxicologist to review the data once we get final packages.

Thanks
